

## Harvest

Organism can be harvested from any plate or broth if it is a pure culture, e.g., antibiotic susceptibility plate. The age of the culture is not important but purity of microbial sample is the key for accurate identification. For every bacteria, pick up a colony and transfer it into an Eppendorf tube containing 50 µl of water. Suspend the cells by vortexing and then treat 5 min. at 100 °C. You can send also 200 ng of genomic DNA (conc. 2,5 ng/ µl).
